COP2806C Module 9 Programming Assignment: Integrating Your Spring Application with External Systems

In this assignment we will work with Java Messaging and Spring messaging integration.

The GitHub Classroom assignment repo contains the full Chapter 9 project content from our textbook. The application can be built and executed from the isf6 folder using **gradle :chapter09:run** or by executing the build task from IntelliJ's Gradle tool.

Your task is to modify the application as follows:

1. Change the message queue name from "documents" to "cop2806c".
2. Modify the application so it sends 25 documents instead of 20.

Submit your modified source to the repo and include two screen snips in your submission:

- One snip showing the application output at the point where it is configuring the message queue using the new name.
- A snip showing the application output at the point where it has sent the additional 5 documents.
